

Experiments for Advanced Materials Science and Engineering I

Lab Report

Experiment N: <Experiment title>

Name: 张三

Student ID: 12410000

Date of experiment: YYYY/MM/DD

Date of submission: YYYY/MM/DD

Team member (if any): 李四, 王五

1. Objectives

- (1) To <goal 1 of the experiment, taken from the manual>.
- (2) To <goal 2: the characterisation or skill to master>.

2. Principles

<Condensed theory behind the experiment —key formulas and a principle figure. Keep within one page.>

3. Experimental materials and setups

Chemicals: <reagent 1>, <reagent 2>, ...

Apparatuses: <apparatus 1>, <apparatus 2>, ...

4. Experimental procedures

- (1) <Step 1 of the in-class operation>.
- (2) <Step 2>.
- (3) <Step 3>.

5. Results and discussion

<2-3 sentences of prose describing the procedure flow with the key measured numbers inline, then the data table.>

5.1 <e.g. Experimental data>

Table 5.1 Density and tensile strength of the samples.

Sample	Density (ρ , g cm ⁻³)	Tensile strength (σ , MPa)
A	1.25	85.2
B	1.42	112.8

6. Conclusion

<1-2 short paragraphs, 300 words: what was done, the critical numbers and results against the theory, the source of errors.>

7. Questions

- (1) <Restate the manual's question, then answer in 2-3 sentences>.

Figure 5.1 <Result of the experiment, e.g. a spectrum, pattern or micrograph with a scale bar>.

8. References
