

<Course name>

Lab Report

Experiment N: <Experiment title>

Name: <Name>

Student ID: <SID>

Date of experiment: YYYY/MM/DD

Date of submission:

Team member (if any):

1. Objectives

- (1) To <goal 1 of the experiment, taken from the manual>.
- (2) To <goal 2: the characterisation or skill to master>.

2. Principles

<Condensed theory behind the experiment —key formulas and the principle figure. Keep within one page. Do not teach textbook background.>

$$< thegoverningrelation > \quad (2.1)$$

3. Experimental Materials and Setups

Chemicals: <reagent 1>, <reagent 2>, ... Apparatuses: <apparatus 1>, <apparatus 2>, ...
Tools: <tool 1>, <tool 2>, ...

4. Experimental Procedures

- (1) <Step 1 of the in-class operation>.
- (2) <Step 2>.
- (3) <Step 3>.

5. Results and Discussion

5.1 Phenomena

<What was seen: color, appearance, when it changed, what was surprising.>

5.2 Experimental Data

<2-3 sentences of prose carrying the key measured numbers, then the table.>

Table 5.1 <Concise title of the table.>

Quantity	Value
Density of sample A (ρ , g cm ⁻³)	1.25
Tensile strength of sample A (σ , MPa)	85.2

5.3 Error Analysis

<Required by the rubric: quantitative or qualitative error sources, and how they were reduced. Never invent an uncertainty the manual or the user did not state.>

6. Conclusion

<1-2 short paragraphs, 300 words: what was successfully prepared, the critical numbers against theory, the cause of the shortfall. No personal pronouns, no "we learned".>

7. Questions and Further Thoughts

(1) <Restate the manual's question.>

<Answer in 2-3 sentences: one physical reason plus one observation from this experiment.>

8. Raw Data and Preview Report
